

QC SKILL · RECONSTRUCTION SPECIFICATION

qc-docs

Standardize repository documentation so a new engineer or operator can run, diagnose, recover, and hand off the system that exists. Four quality gates. Requires qc-core.

Canonical source of truth is the **SKILL.md** tree in this repository. This PDF reconstructs that tree for porting. Do not treat this PDF as a second design. Do not vendor a specialization without **qc-core**.

Role

REQUIRED: load qc-core first. Laws, ledger schema 1.1, verdict, profile (operating_facts, truth_map), deferred vocabulary, and suite order live there. This skill is the documentation specialization. It runs last in qc-all so the truth-map matches the code that survived hardening and coherence.

Produce the minimal complete documentation set that lets a new engineer or operator correctly understand, run, diagnose, recover, and hand off the **system that actually exists**. Document residual debt from prior audits. Never invent features, infrastructure, SLAs, or operating procedures that are not grounded in the repository or verified user input.

Relationship

Skill	Relationship
qc-core	Shared contract. Load first.
qc-packaging	Packaging and release polish. Runs first in the suite.
qc-hardening	Defect reduction. Runs before docs.
qc-coherence	Cross-cutting consistency. Runs before docs.
qc-docs	Documentation structure, accuracy, handoff, operational standardization. Last.

Four quality gates

A production-docs pass is only complete when all four gates pass.

Gate	Name	Bar
1	Completeness	Dual: (1) required docs for the archetype exist; (2) every operator-relevant surface the code exposes is documented. Absence of coverage for a code-surfaced concern is a Completeness finding.
2	Accuracy	Commands, env, interfaces, and claims match code. Non-trivial ARCHITECTURE / OPERATIONS / API / DATA_MODEL claims need a truth_map[] row. P1+ findings use the operator-path scenario.
3	Clarity	README answers what this is, how to run it, and where to go next in under five minutes. No duplicated runbooks.
4	Handoff Readiness	A competent new engineer can perform the archetype's first-day path and first-incident path using only the doc set. Known limitations from prior qc ledgers are surfaced. Do not invent recovery.

Done definition: Completeness, Accuracy, Clarity, and Handoff Readiness are all green. Stop when all four gates pass and the current pass found only P3 issues or none.

Truth-map and known limitations

Write `truth_map[]` on `.qc-profile.json` before editing. Evidence is `file:line`, a test name, or `user-provided:<id>` referencing `operating_facts[]`. Known limitations are synthesized from `profile_deferred[]` + `hot_spots[]` + `pass_debt[]` + `untested_invariants[]`. Do not invent mitigations. Skip that section on a standalone docs run with no prior ledgers.

Landing page

README.md is the GitHub landing page. It must be readable by a new engineer in under five minutes: what this is, how to install or run it, where deeper docs live. Every linked path exists. Every documented command is a real command. Route; do not dump the full runbook into the README.

What not to do

- Do not create empty template files with no repo-specific content.
- Do not document endpoints, commands, or environment variables that are not present.
- Do not invent SLAs, dashboards, or recovery procedures.
- Do not copy `qc-finding.schema.json` into this skill; call `qc-core`.
